Updated Review of Solid Element Formulations in LS-DYNA

Properties, Limits, Advantages, Disadvantages

Christoph Schmied, DYNAmore
Tobias Erhart, DYNAmore

Bamberg, 17 October 2018

Motivation

Solid elements are three-dimensional finite elements that can model solid bodies and structures without any a priori geometric simplification.

- No geometric, constitutive and loading assumptions required.
- Boundary conditions treated more realistically. (compared to shells or beams).
- FE mesh visually looks like the physical system.

but...

- Higher effort: mesh preparation, CPU time, post-processing, ...
- Expensive mesh refinement: Curse of dimensionality.
- Often poor performance for thin-walled structures (locking problems).

Applications

- Foam Structures
- Rubber components
- Cast iron parts
- Solid barriers
- Plastic parts
- Bulk forming
- Thick metal sheets
- Elastic tools
- Impact analysis
- ...

Overview

LS-DYNA User's manual: *SECTION_SOLID, parameter ELFORM

EQ.-2 Fully integrated S/R solid intended for elements with poor aspect ratio, accurate formulation

EQ.-1 Fully integrated S/R solid intended for elements with poor aspect ratio, efficient formulation

EQ.1 Constant stress solid element: default element type

EQ.2 Fully integrated S/R solid.

EQ.3 Fully integrated quadratic 8-node element with nodal rotations

EQ.4 S/R quadratic tetrahedron element with nodal rotations

EQ.10 1 point tetrahedron

EQ.13 1 point nodal pressure tetrahedron

EQ.15 2 point pentahedron element

EQ.16 4 or 5 point 10-noded tetrahedron

EQ.17 10-noded composite tetrahedron

EQ.23 20-node solid formulation

EQ.24 27-noded, fully integrated S/R quadratic solid element

EQ.115 1 point pentahedron element with hourglass control

New quadratic Elements (use R10)

Overview

LS-DYNA User's manual: *SECTION_SOLID, parameter ELFORM

EQ.-2 Fully integrated S/R solid intended for elements with poor aspect ratio, accurate formulation

EQ.-1 Fully integrated S/R solid intended for elements with poor aspect ratio,

Standard hexahedral elements

EQ.1 Constant stress solid element: default element type

EQ.2 Fully integrated S/R solid.

EQ.3 Fully integrated quadratic 8-node element with nodal rotations

EQ.4 S/R quadratic tetrahedron element with nodal rotations

EQ.10 1 point tetrahedron

EQ.13 1 point nodal pressure tetrahedron

EQ.15 2 point pentahedron element

EQ.16 4 or 5 point 10-noded tetrahedron

EQ.17 10-noded composite tetrahedron

EQ.23 20-node solid formulation

EQ.24 27-noded, fully integrated S/R quadratic solid element

EQ.115 1 point pentahedron element with hourglass control

Standard hexahedra elements in LS-DYNA

ELFORM = 1

- underintegrated constant stress
- efficient and accurate
- even works for severe deformations
- needs hourglass stabilization:
choice of hourglass formulation
and values remains an issue

ELFORM = 2

- selective reduced integrated brick element
(volumetric locking alleviated)
- slower than ELFORM=1
- more unstable in large deformation applications
- no hourglass stabilization needed
- too stiff in many situations, especially for poor
aspect ratios (shear locking)

Hourglass control for ELFORM=1

*HOURGLASS: IHQ = 1...5

- viscous form (1,2,3) for higher velocities
- stiffness form (4,5) for lower velocities
- exact volume integration recommended (3,5)

*HOURGLASS: IHQ = 6

- the QBI (Quintessential Bending Incompressible) hourglass control by Belytschko and Bindeman
- hourglass stiffness uses elastic constants
- **recommended in most situations**
- sometimes modified QM makes sense (watch hourglass energy)

*HOURGLASS: IHQ = 7/9

- similar to type 6, but less experience
- type 7 uses total deformation instead of updated
- type 9 should provide more accurate results for distorted meshes

Hourglassing pattern

Hourglass control

Property of ELFORM=2

Shear locking

- Pure bending modes trigger spurious shear energy
- Getting worse for poor aspect ratios

$$\varepsilon_{xx} = 2\xi_y/l_x, \varepsilon_{yy} = 0, \gamma_{xy} = \xi_x/l_y$$

Alleviation of shear locking

1. Underintegration \rightarrow ELFORM = 1
2. Modified strain formulations \rightarrow modified Jacobian matrix

$$\longrightarrow \varepsilon_{xx} = 2\xi_y/l_x, \varepsilon_{yy} = 0, \gamma_{xy} = \dots = \xi_x/l_x \longrightarrow \text{ELFORM} = -1, -2$$

Overview

LS-DYNA User's manual: *SECTION_SOLID, parameter ELFORM

EQ.-2 Fully integrated S/R solid intended for elements with poor aspect ratio, accurate formulation

EQ.-1 Fully integrated S/R solid intended for elements with poor aspect ratio, efficient formulation

Improved hexahedral elements

EQ.1 Constant stress solid element:
default element type

EQ.2 Fully integrated S/R solid.

EQ.3 Fully integrated quadratic 8-node element with nodal rotations

EQ.4 S/R quadratic tetrahedron element with nodal rotations

EQ.10 1 point tetrahedron

EQ.13 1 point nodal pressure tetrahedron

EQ.15 2 point pentahedron element

EQ.16 4 or 5 point 10-noded tetrahedron

EQ.17 10-noded composite tetrahedron

EQ.23 20-node solid formulation

EQ.24 27-noded, fully integrated S/R quadratic solid element

EQ.115 1 point pentahedron element with hourglass control

Solid element formulations -1 and -2

Thomas Borrvall: „A heuristic attempt to reduce transverse shear locking in fully integrated hexahedra with poor aspect ratio“, Salzburg 2009

Original Jacobian matrix

$$J_{ij}^{\text{orig}} = \frac{\partial x_i}{\partial \xi_j} = x_{Ii} \frac{1}{8} \left(\xi_j^I + \xi_{jk}^I \xi_k + \xi_{jl}^I \xi_l + \xi_{123}^I \xi_k \xi_l \right)$$

Modification of the Jacobian matrix

Reduction of spurious stiffness without affecting the true physical behavior of the element

$$J_{ij}^{\text{mod}} = x_{Ii} \frac{1}{8} \left(\xi_j^I + \xi_{jk}^I \xi_k \kappa_{jk} + \xi_{jl}^I \xi_l \kappa_{jl} + \xi_{123}^I \xi_k \kappa_{jk} \xi_l \kappa_{jl} \right)$$

aspect ratios between dimensions computed **efficiently**

- computed once at time zero
- with edge lengths through element center

Improved hexahedral elements

Identical with ELFORM=2 but accounted for **poor aspect ratio** in order to reduce shear locking

ELFORM = -1

- **efficient** formulation
- sometimes hourglass tendencies

ELFORM = -2

- **accurate** formulation
- higher computational cost than type -1

CPU cost compared to ELFORM=2 for **explicit analysis**

≈ 1.2 (ELFORM=-1)

≈ 2.0 to 3.5 (ELFORM=-2)

... but implicit ELFORM -2 is a good choice!

Overview

LS-DYNA User's manual: *SECTION_SOLID, parameter ELFORM

EQ.-2 Fully integrated S/R solid intended for elements with poor aspect ratio, accurate formulation

EQ.-1 Fully integrated S/R solid intended for elements with poor aspect ratio, efficient formulation

EQ.1 Constant stress solid element: default element type

EQ.2 Fully integrated S/R solid.

EQ.3 Fully integrated quadratic 8-node element with nodal rotations

EQ.4 S/R quadratic tetrahedron element with nodal rotations

EQ.10 1 point tetrahedron

EQ.13 1 point nodal pressure tetrahedron

EQ.15 2 point pentahedron element

EQ.16 4 or 5 point 10-noded tetrahedron

New hexahedral elements tetrahedron

EQ.23 20-node solid formulation

EQ.24 27-noded, fully integrated S/R quadratic solid element

EQ.115 1 point pentahedron element with hourglass control

Quadratic hexahedron element formulations (use R10)

Good bending behaviour

ELFORM = 23

8 corner + 12 edge nodes

14 integration points

- Serendipity formulation – not fully quadratic
- Faster than ELFORM 24

ELFORM = 24

8 corner + 12 edge
+ 6 surface
+ 1 center node

27 integration points
(3x3x3)

- Fully quadratic displacement field
- 21 degrees of freedom more than ELFORM 23
- S/R integration

Compared to 8-node solid hexahedral “coarse meshes” often sufficient for convergence

Quadratic hexahedron element formulations (use R10)

Automatic node generation similar to *ELEMENT_SOLID_TET4TOTET10

*ELEMENT_SOLID_H8TOH20

*ELEMENT_SOLID_H8TOH27

Nodes generated during initialization
– kept for post-processing

Mid-nodes automatically
generated for
straight edges
of 8-noded hexahedron

**Good for meshes with
initially straight edges**

- Boundary conditions partly translated
- Size of time step getting smaller

Quadratic hexahedron element formulations (use R10)

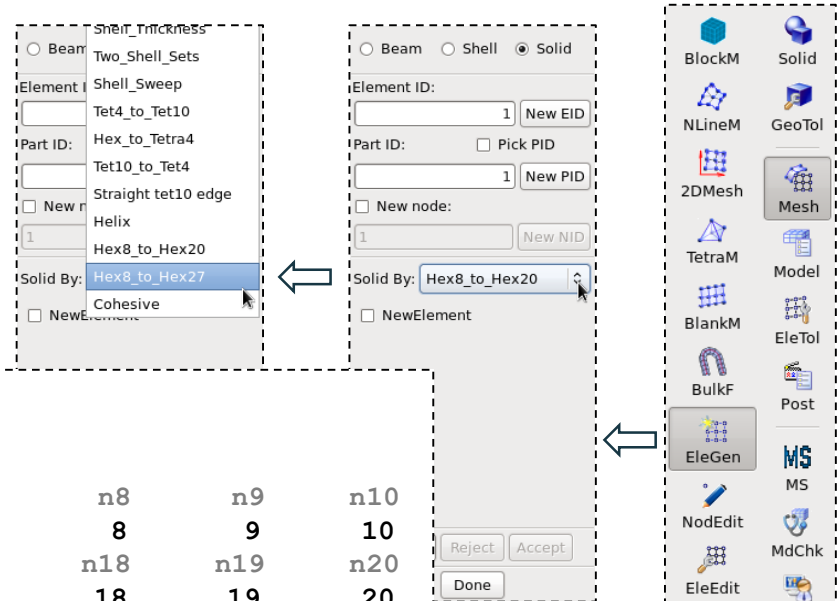

Define nodes a priori with mesh generator / LSPP

*ELEMENT_SOLID_H20

*ELEMENT_SOLID_H27

*ELEMENT_SOLID_H27

Overview

LS-DYNA User's manual: *SECTION_SOLID, parameter ELFORM

EQ.-2 Fully integrated S/R solid intended for elements with poor aspect ratio, accurate formulation

EQ.-1 Fully integrated S/R solid intended for elements with poor aspect ratio, efficient formulation

EQ.1 Constant stress solid element: default element type

Quadratic element with rotation

EQ.3 Fully integrated quadratic 8-node element with nodal rotations

EQ.4 S/R quadratic tetrahedron element with nodal rotations

EQ.10 1 point tetrahedron

EQ.13 1 point nodal pressure tetrahedron

EQ.15 2 point pentahedron element

EQ.16 4 or 5 point 10-noded tetrahedron

EQ.17 10-noded composite tetrahedron

EQ.23 20-node solid formulation

EQ.24 27-noded, fully integrated S/R quadratic solid element

EQ.115 1 point pentahedron element with hourglass control

Quadratic solid element with nodal rotations

ELFORM = 3

- Quadratic 8 node hexahedron with nodal rotations, i.e. 6 DOF per node
- Full integration (12 point)
- Well suited for connections to shells
- Good accuracy for small strains
- Tendency to volumetric locking – possible remedy: incompatible modes

Pawlak, TP and Yunus, SM: *Solid elements with rotational degrees of freedom: Part 1 – Hexahedron elements*, IJNME 1991

Teng, H: *Solid elements with Rotational Degree of Freedom for Grand Rotation Problems in LS-DYNA*, 11th International LS-DYNA Users Conference, 2010

Examples part 1

Implicit elastic bending

- clamped plate of dimensions 10x5x1 mm³
- subjected to 1 Nm torque at the free end
- E = 210 GPa
- analytical solution for end tip deflection: 0.57143 mm
- convergence study with aspect ratio 5:1 kept constant

End tip deflection, different mesh discretizations and element types, error in parenthesis.

Mesh	ELFORM 2	ELFORM -2	ELFORM -1	ELFORM 3	ELFORM23	ELFORM 24
2x1x1	0.0564(90.1%)	0.6711(17.4%)	0.6751(18.1%)	0.4001(30.0%)	0.5264(7.8%)	0.5525(3.3%)

Linear tetrahedral elements element

EQ.16 4 or 5 point 10-noded tetrahedron

EQ.17 10-noded composite tetrahedron

EQ.23 20-node solid formulation

EQ.24 27-noded, fully integrated S/R quadratic solid element

EQ.115 1 point pentahedron element with hourglass control

Linear tetrahedral elements in LS-DYNA

ELFORM = 10

- 1-point constant stress
- Volumetric locking – stiff behavior
- Only applicable for foams with $\nu = 0$ (not recommended in general)
- Often used for transitions in meshes
*CONTROL_SOLID, ESORT=1

ELFORM = 13

- 1-point constant stress with nodal pressure averaging to alleviate volumetric locking
- Better performance than ELFORM=10 if Poisson's ratio $\nu > 0$ (metals, rubber, ...)
- Supported materials for explicit
*MAT_001, 003, 006, 007, 015, 024, 027, 077, 081, 082, 091, 092, 098, 103, 106, 120, 123, 124, 128, 129, 181, 183, 187, 224, 225, 244
- Implicit: all materials supported

Linear tetrahedra elements in LS-DYNA

Theoretical background

Bonet J, Burton, AJ: *A simple average nodal pressure tetrahedral element for incompressible dynamic explicit applications*. Comm. Num. Meth. Engrg. 14: 437-449, 1998

“(...) the element **prevents volumetric locking** by defining nodal volumes and evaluating average nodal pressures in terms of these volumes (...)”

“(...) it can be used in explicit dynamic applications involving (nearly) **incompressible material behavior** (e.g. rubber, ductile elastoplastic metals) (...)”

Speed penalty of max. 25% compared to TET#10

➔ TET 13 = TET 10 + averaging nodal pressures
= TET 10 - volumetric locking

Overview

LS-DYNA User's manual: *SECTION_SOLID, parameter ELFORM

EQ.-2 Fully integrated S/R solid intended for elements with poor aspect ratio, accurate formulation

EQ.-1 Fully integrated S/R solid intended for elements with poor aspect ratio, efficient formulation

EQ.1 Constant stress solid element: default element type

EQ.2 Fully integrated S/R solid.

EQ.3 Fully integrated quadratic 8-node element with nodal rotations

EQ.4 S/R quadratic tetrahedron element with nodal rotations

EQ.10 1 point tetrahedron

EQ.13 1 point nodal pressure tetrahedron

Higher order tetrahedral elements

EQ.16 4 or 5 point 10-noded tetrahedron

EQ.17 10-noded composite tetrahedron

EQ.23 20-node solid formulation

EQ.24 27-noded, fully integrated S/R quadratic solid element

EQ.115 1 point pentahedron element with hourglass control

Higher order tetrahedral elements

ELFORM = 16

- 4(5) point 10-noded tetrahedron
- Good accuracy for moderate strains
- High cpu cost
- Observe the node numbering
- Use *CONTACT_AUTOMATIC_... with PID
- Easy conversion of 4-noded tets via *ELEMENT_SOLID_TET4TOTET10
- Midside nodes: *CONTROL_OUTPUT, TET10=1

ELFORM = 17

- 4(5) point 10-noded „composite“ tetrahedron (12 linear sub-tetrahedrons)
- Properties similar to type 16
- Correct external force distribution

Automatic node generation
*ELEMENT_SOLID_TET4TOTET10
Similar to *ELEMENT_SOLID_H8TOH20/_H8TOH27

Overview

EQ.15 2 point pentahedron element

Pentahedron element and tetrahedron

EQ.17 10-noded composite tetrahedron

EQ.23 20-node solid formulation

EQ.24 27-noded, fully integrated S/R

Pentahedron element element

EQ.115 1 point pentahedron element with hourglass control

Pentahedra elements in LS-DYNA

ELFORM = 15

- 2-point selective reduced integration
- needs hourglass stabilization for twist mode (recent improvement → next official versions)
- often used as transition element (ESORT=1)

ELFORM = 115

- 1-point reduced integration
- needs hourglass stabilization (analogue to hexahedron element type 1 with Flanagan-Belytschko hourglass formulation)

should in general be avoided – better: pure hexahedral or tetrahedral meshes

Time step control

Critical time step

$$\Delta t_e = \frac{L_e}{Q + (Q^2 + c^2)^{1/2}} \approx \frac{L_e}{c}$$

L_e = main information from element formulation

Adiabatic sound speed

$$c = \sqrt{\frac{E(1-\nu)}{(1+\nu)(1-2\nu)\rho}} = \sqrt{\frac{K + \frac{4}{3}G}{\rho}}$$

Characteristic element length

ELFORM = 1, 2, 3, -1, -2: $L_e = V/A_{max}$

ELFORM = 4: $L_e = 0.85 h_{min}$

ELFORM = 10 / 13: $L_e = h_{min}$

ELFORM = 16: $L_e = 0.3889 h_{min}$

ELFORM = 17: $L_e = V/A_{max}$

ELFORM = 15: $L_e = 1/\sqrt{B_{ij}B_{ij}}$

Time step control

Example 1

Time step size for
same volume

Example 2

Time step size for
same edge length

Conclusions and remarks

- Use hexahedron elements if possible (regular solid bodies)
 - ELFORM = 1 with IHQ = 6 or ELFORM = 2, 3
 - ELFORM = -1 or -2 for „flat“ hexas
- Quadratic ELFORM 23, 24 show good coarse mesh accuracy
- But for large strains linear elements in general more robust

use R10

- Pentahedrons 15/115 should be avoided or only be used as transition elements, pure tetrahedral mesh is better choice

General remarks

- In implicit analysis: costly element formulations may be used – not as significant for speed as in explicit analysis
- Always set ESORT = 1 on *CONTROL_SOLID

Conclusions and remarks

- For complex solid structures, use tet type 4, 13, 16, or 17
 - ELFORM = 16/17 are the most accurate tets, but not suited for large strains
 - ELFORM = 13 needs finer mesh, well suited even for large strains
(check if your material is supported)
- For metals or plastics (moderate strains), use tet type 4, 13, 16, or 17
- For rubber materials (incompressible, large strains) use tet type 13
- For bulk forming problems (large strains!), use ELFORM = 13 and r-adaptivity

General remarks

- In implicit analysis: costly element formulations may be used – not as significant for speed as in explicit analysis
- Always set ESORT = 1 on *CONTROL_SOLID

Conclusions and remarks

*SECTION_SOLID, parameter ELFORM

EQ.25 21-noded quadratic pentahedron

EQ.26 15-noded quadratic tetrahedron

EQ.27 20-noded cubic tetrahedron

EQ.28 40-noded cubic pentahedron

EQ.29 64-noded cubic hexahedron
